What is this Course About

Grouped data arise in a wide range of disciplines

- Typical examples of grouped data
 - > repeated measurements: measuring the same outcome multiple times on the same sample unit (e.g., biomarkers in patients)

What is this Course About (cont'd)

- Statistical analysis of clustered/grouped data

 - ▷ describe their distribution

Lexical convention

- The following terms are used interchangeably to denote multivariate outcomes

 - > repeated measurements data

 - ⊳ grouped data

Learning Objectives

- Goals: After this course participants will be able to
 - ▷ identify settings in which a repeated measurements model is required,
 - > construct and fit an appropriate model to the data at hand, and
 - > correctly interpret the results
- Even though the course will be primarily explanatory
 - > sufficient mathematical detail will be provided in order participants to obtain a clear view on the different modeling approaches, and how they should be used in practice

Agenda

• Chapter 1: Motivating Data Sets

- Data sets that we will use throughout the course
- > Formulation of possible research questions
- > Features of repeated measurements data

• Chapter 2: Marginal Models for Continuous Data

- Naive approaches

Agenda (cont'd)

- Chapter 3: The Linear Mixed Effects Model

 - Nested and cross random effects
- Chapter 4: Marginal Models for Discrete Data

Agenda (cont'd)

- Chapter 5: Mixed Models for Discrete Data
 - □ Generalized linear mixed effects models
 - > interpretation of parameters
 - □ approximations of the integrand & integral
- Chapter 6: Statistical Analysis with Incomplete Grouped Data
 - > Problems with incomplete data

 - > Valid inferential approaches

Structure of the Course & Material

- Lectures & software practicals using R
- Material:
- Within the course notes there are several examples of R syntax these are denoted by the symbol 'R> '

Software Requirements

• The up-to-date versions of R and Rstudio; downloadable from

```
> https://cran.r-project.org/
> https://www.rstudio.com/
```

- Additional required packages

 - **▷ MASS**, lattice, shiny, corrplot

Software Requirements

 Up-to-date versions of these packages and their dependencies can be installed using the command

- Up-to-date version of a modern web browser, e.g.,

 - □ Google Chrome (https://www.google.com/chrome/)

Software Requirements

- We will use a **shiny** web app that replicates all analyses in the course including also some additional illustrations
- The app is available on GitHub and can be invoked using the following two-step procedure (assuming internet connection is available and you have installed the aforementioned packages)
 - 1. Start R
 - 2. Run the command

```
shiny::runGitHub("Repeated_Measurements", "drizopoulos")
```

this will open a new web browser window (or tab) with the app

• Note: in order the app to be functional you should not close R

Use of Statistical Models

... the megalomaniacal strategy of fitting a grand unified model, supposedly capable of answering any conceivable question that might be posed, is, in our view, dangerous, unnecessary and counterproductive.

Drum and McCullach (1993, Statistical Science 8, 300-301)
